

Community Adaptation Decision Making Exercise

This exercise explores the diversity in climate change impacts across different community contexts, and uses these differences to plan for future adaptation. Participants will be grouped according to hypothetical communities and, based on the community profiles provided, will identify climate risks to these communities and suggest the best ways to address them. All material can be found in the Community Adaptation Decision Making Exercise folder. Each Community will answer the following questions:

1. State why climate change is a point of consideration for your given community.
 - a. State three climate variables which may impact your community.
 - b. Why are they important?

You may use the impact tables in the State of the Jamaican Climate document in the Community Adaptation Decision Making Exercise folder.

Presentations will be made using the Community Adaptation Activity Power Point Template provided.
